

Serial Bluetooth wireless setup configuration examples.

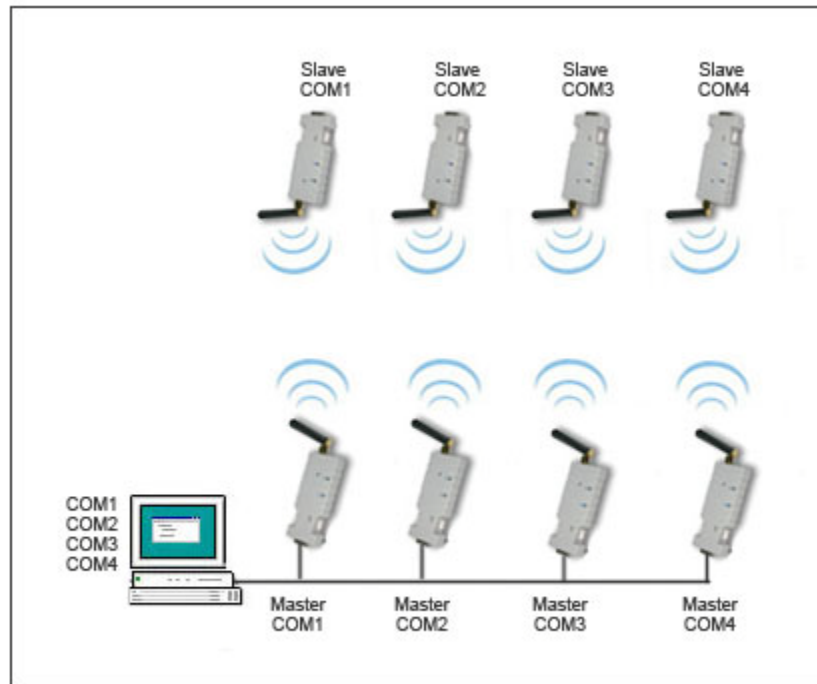

Cable replacement. One Master adapter communicates with one Slave adapter to create a wireless link between a computer and a serial device. Only one Slave can be connected to one Master. Often used if PC has no built-in Bluetooth.

PC has built-in Bluetooth. One to one communication between built-in Bluetooth and serial device.

Most popular: point to multipoint configuration. Up to 7 Slaves can link with one Master adapter or built-in / external USB Bluetooth dongle. Each COM port of the slaves shows up in Device Manager.

Multiple serial Bluetooth adapters. Ideal for applications where more than 7 links are needed, (max 255). Multiple COM ports required. COM port can be selected manually with external switch.
